

JetAdvice Hybrid Standard

JetAdvice Hybrid enables the ability to have the data from JetAdvice Manager servers available locally to create your own reports and integrate directly into your backoffice systems; for example meter readings and supply ordering.

What is JetAdvice Hybrid?

JetAdvice Hybrid is the HUB between the online JetAdvice Manager service and your local back-office systems and business processes; making sure your online data is readily available locally.

JetAdvice Hybrid allows you to have data stored on your "preferred" local Microsoft SQL database at your preferred location; being in your building or at your preferred hosting center or any place of your choice.

The data will be stored where your key software would need to get access to the data.

Technologies used

JetAdvice Hybrid uses the JetAdvice API to exchange data from JetAdvice Manager to JetAdvice Hybrid.

System requirements

- Microsoft SQL 201x installed, patched and ready to use
- Ports: 443 (https) UDP and TCP

Installation requirements

- Dedicated technical contact person on location
- Remote access to "preferred" local database or Microsoft SQL server

Standard Information

JetAdvice Hybrid Standard offers a comprehensive set of data from JetAdvice Manager. For a full list of data have a look at the back page. If you require more data, we do offer different options known as "Towers".

Not included

Information not included in JetAdvice Hybrid:

- Historical data
- Alerts (use email or API instead)

Data Frequency

Data type	Readings per day
Dealer Info.	1
Customer Info.	1
User Info.	1
Device Info.	1
Device Readings	1
Supply Info.	1
Supply Readings	up to 3
Supply Definitions	1
Printer Definitions	1
Manufacturer Info.	1
